Hospital Bed & ICU Bed Allocation System

Name: Nishanth Nag M V

SRN: PES1UG24AM381

Reflection Questions

1. Did your estimations reflect the actual effort?

Mostly yes — the 8-point stories were the ones with genuine algorithmic or concurrency complexity, so weighting them highest made sense. The 3-point stories were comparatively simple form/status work, which matched how quickly they were completed. Where a story felt harder or easier than its point value suggested while moving it through To Do → In Progress → Done, that's worth calling out specifically — for example, if double-booking prevention took longer than its 8 points implied, that's a sign the concurrency logic was under-estimated.

2. Was your backlog well-prioritized?

Yes — putting Epics 1, 2, and 5 (vitals intake, triage scoring, live bed dashboard, authentication, and role-based access) into Sprint 1 was the right call, since none of the other features are safe to use without accurate triage data, real-time bed visibility, or access control in place. The Medium-priority transfer feature (Epic 4) reasonably waited

for Sprint 2, since ambulance transfers only matter once you already know a bed isn't available locally — it depends on the Sprint 1 features rather than blocking them.

3. How did your simulated sprint align with your plan?

Sprint 1 was scoped to exactly the 6 stories from Epics 1, 2, and 5, and Sprint 2 picked up the remaining 4 stories from Epics 3 and 4. If everything moved into Sprint 1 reached Done before Complete sprint was clicked, that means the plan and the simulated execution matched cleanly. If anything rolled over into Sprint 2 instead, the specific story and reason should be noted (usually either it was under-estimated or Sprint 1 was slightly overloaded at 39 points across 6 stories).

4. What insights did the burndown chart give about your team's capacity?

If the red "Remaining Values" line tracked at or below the grey guideline, that suggests the story-point estimates were reasonably close to real capacity for a 1-week sprint. If the chart instead showed a sharp vertical drop rather than a steady staircase, that usually means a large story (likely one of the 8-pointers) was completed in one big batch rather than incrementally — a sign it could have been split into smaller stories or subtasks for better visibility. If the line stayed above the guideline for most of the week, that would suggest Sprint 1 was scoped a bit too heavy (39 points is a lot for a solo/simulated 1-week sprint) and a real team might want to trim scope or extend the sprint length.
